

## 4a. Option 1 - Create semantic model connections with Power BI desktop

Training.**tips**

### Sign in to Power BI Desktop

- 1 Open Power BI desktop and click "Sign in".

2

Enter your workshop email address and click "Continue". You'll have to enter your email address one more time and then the password.

×

## Enter your email address

Power BI Desktop and the Power BI service work better together. Sign in to enhance your collaboration and access organizational content.

## Connect to the lakehouse - Import mode

3

We'll start by getting data from the lakehouse. Click the "OneLake catalog" button.

4

Navigate to your lakehouse in your workspace and click the name of the lakehouse.

	Name	Owner	Refreshed	Location	Endorsement
	fabcon info	Stephanie Bruno	—	Public	—
	FabCon Sessions	Stephanie Bruno	9/8/25, 12:03:23 PM	Public	—

	skiina	Stephanie Bruno	—	Public	—

[Learn more about c](#)

Alert! On the next step, do not click the "Connect" button, rather click the down arrow next to the "Connect" button.

5

Don't just click the big green Connect button, because then you'll connect in Direct Lake mode. We want to import this data today. Click the down arrow next to the Connect button and then select "Connect to SQL endpoint."

6

Check the boxes next to both the "sessions" table and the "speakers" table. (If you weren't able to get through the Dataflow Gen2 lab, you can alternatively connect to the two "raw\_" tables instead, but your report just won't be quite as nice.) Click the "Load" button.

Select Related Tables

Load Transform Data Cancel

7

Leave this checked as "Import" and click the "OK" button.

## Connection settings

You can choose how to connect to this data source. Import allows you to bring a copy of the data into Power BI. DirectQuery will connect live to this data source.

- ☒ Import  
☐ DirectQuery

OK

Cancel

## Connect to the SQL database - DirectQuery mode

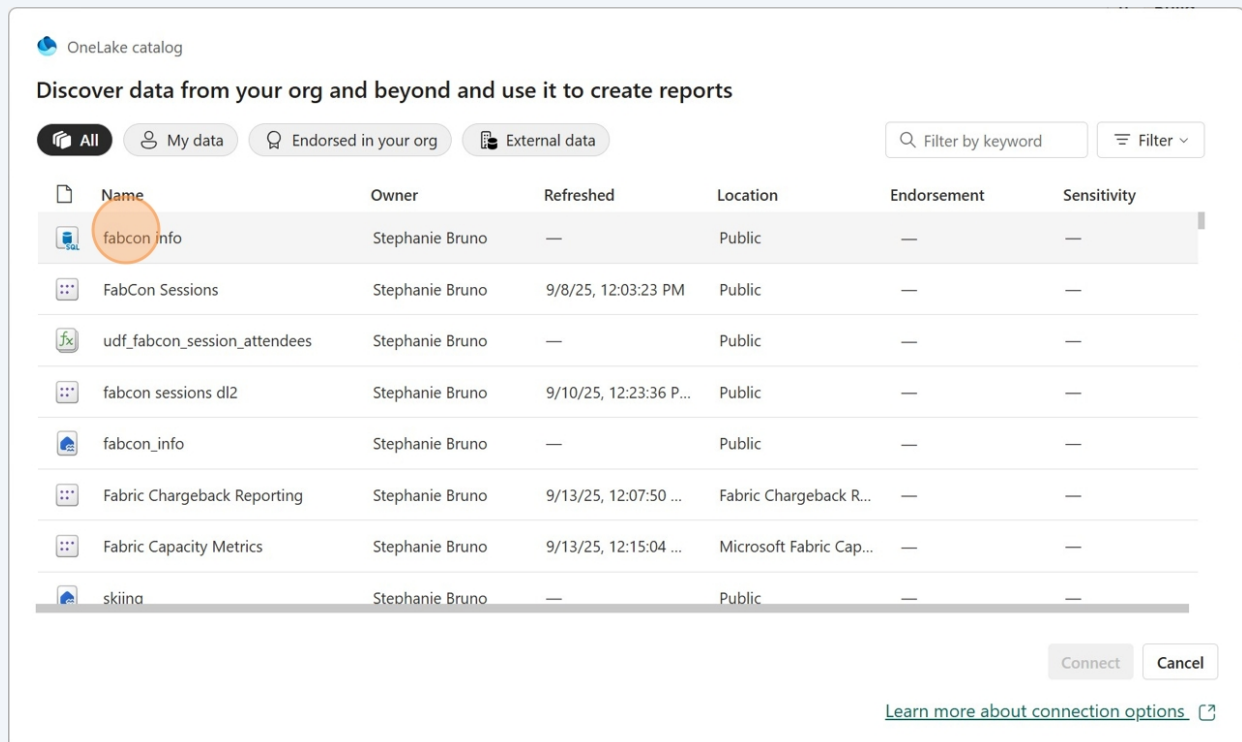

8

Now we'll get the attendees table from the SQL database. Click the "One Lake catalog" button again.

9

Now navigate to your SQL database and click it. Click the "Connect" button.

**10** Check the box next to the "attendees" table and click the "Load" button.

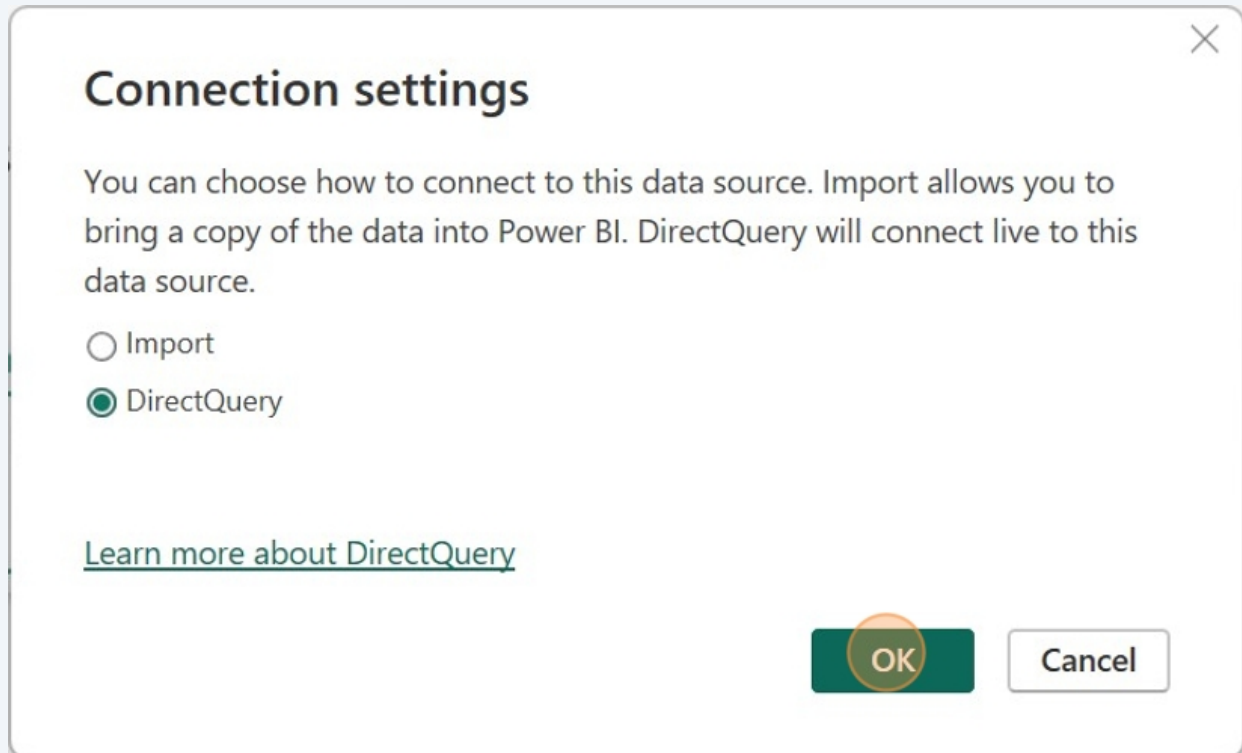

The screenshot shows a data loading interface. On the left, under 'Display Options', a list of tables is shown: 'sys.database\_firewall\_rules', 'attendees', 'session\_tags', 'sessions', and 'speakers'. The 'attendees' table is selected, indicated by a green checkmark in a box. At the bottom left is a 'Select Related Tables' button. On the right, a preview of the 'attendees' table is shown with columns 'session\_id', 'Attendee', and 'Status'. A message states 'This table is empty.' At the bottom right, there are three buttons: 'Load' (highlighted with an orange circle), 'Transform Data', and 'Cancel'.

**Alert!** Make sure to choose DirectQuery for the next step.

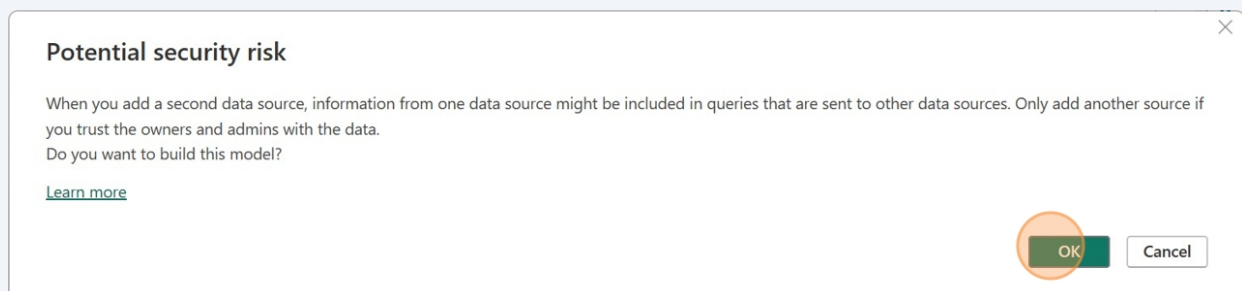

11

For this table, we want the mode to be "DirectQuery" so we can do our write-back and have the updates automatically show in the report. Click "DirectQuery" and then the "OK" button.

12

Click "OK"

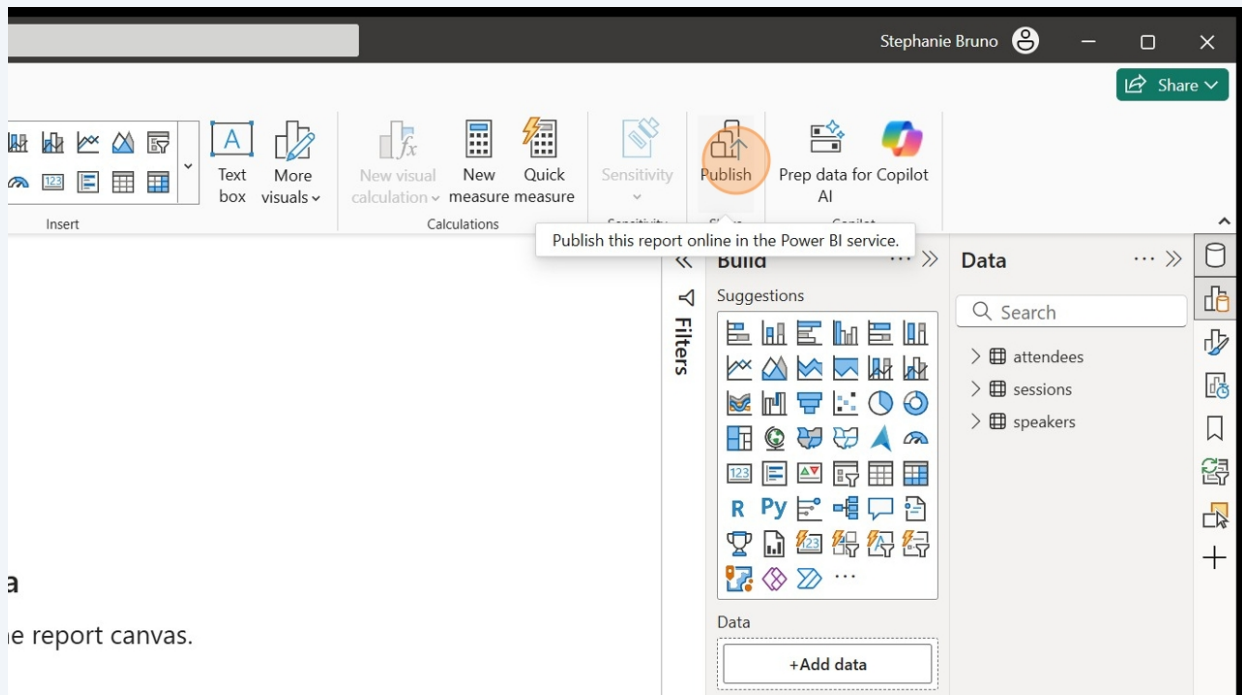

## Publish to Fabric

13

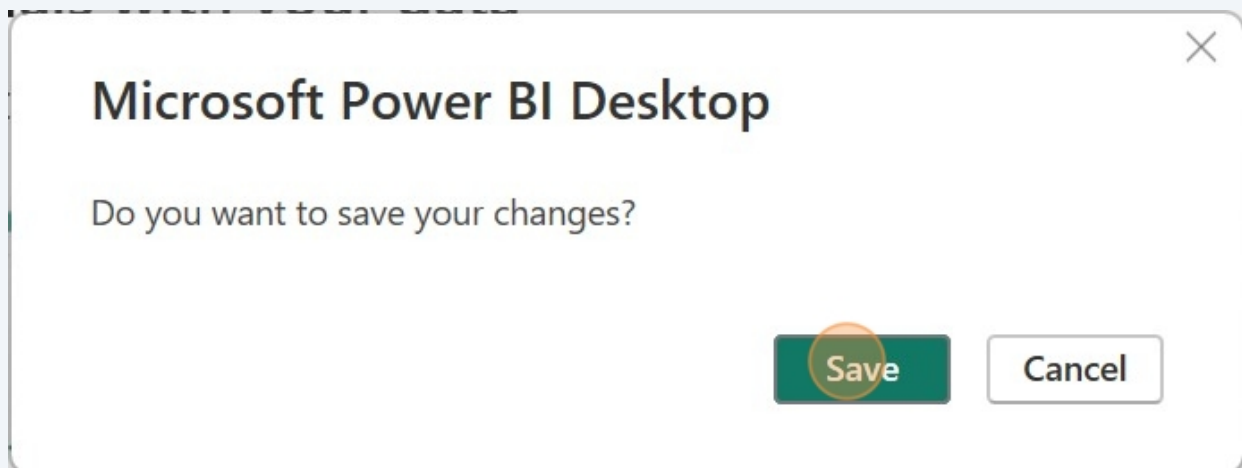

Now we have three tables in a new model. We'll publish it to the Power BI service before making any more changes. Click the "Publish" button.

a  
e report canvas.

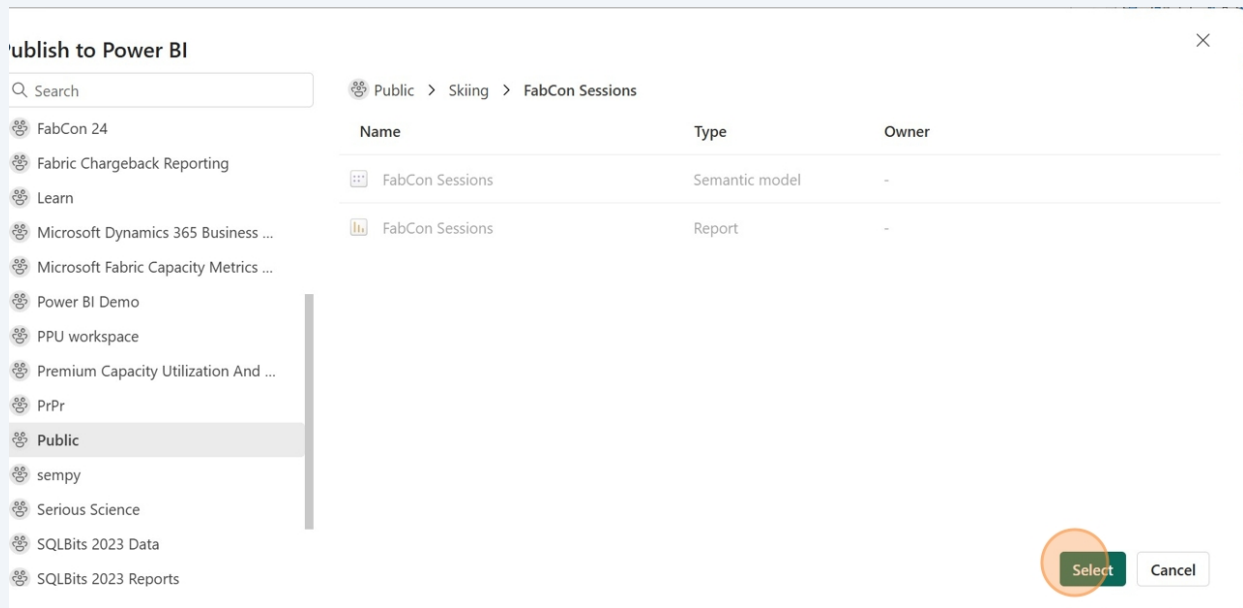

14

When you get a message asking you to Save the file, click the "Save" button and select a location.

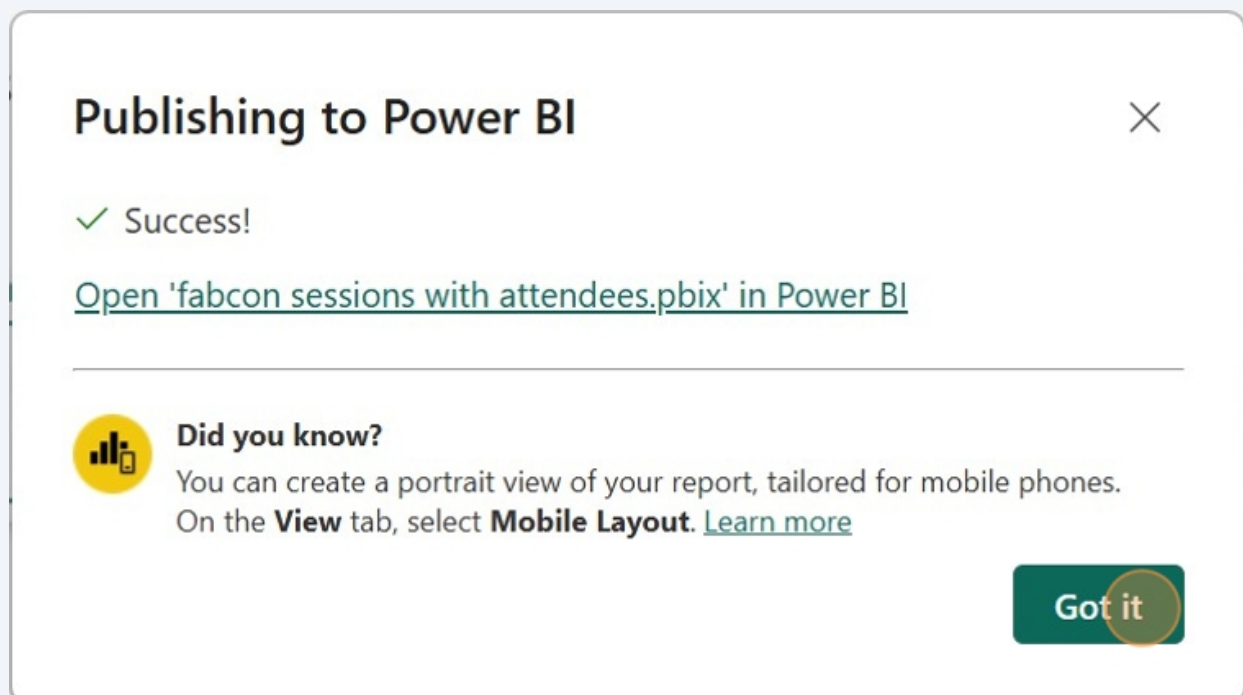

15

Navigate to your workspace and click the "Select" button. This is where the model will be published.

16

Click "Got it"

17

Great! Now we have a starter semantic model published to the workspace. We'll continue to edit it in the workspace.
