

1a. Create a New Workspace and a Lakehouse

In this lab, you'll get started with Fabric by creating a workspace where you'll build artifacts, and a lakehouse to store data.

Log in to Fabric

Tip! Make sure to use an in-private browser session today so the temporary credentials you use won't interfere with your more frequently used logins.

1

Open an in private browser and navigate to <https://app.powerbi.com/home?experience=power-bi>

1. Log in with your attendee email address (PBIF.userXXX@fabconatl.onmicrosoft.com) and the provided password
2. Create a new password
3. Stay signed in if you like

Deployment pipelines

+ New workspace

4

The workspace name must be unique, so name it “PBIF 006 FabCon” if your user account today is PBIF.user006, for example. The name doesn't matter too much today, but it has to be unique in the tenant.

In the real world, you'll put more thought and planning into workspace names.

5

Leave the defaults and click "Apply". If you open the Advanced section you'll see that this is where you define the licensing mechanism for the workspace. Today we'll default to a Power BI Premium workspace. Make sure not to change this. A workspace has to use a Premium or Fabric SKU capacity for any non-Power BI items to be created.

6

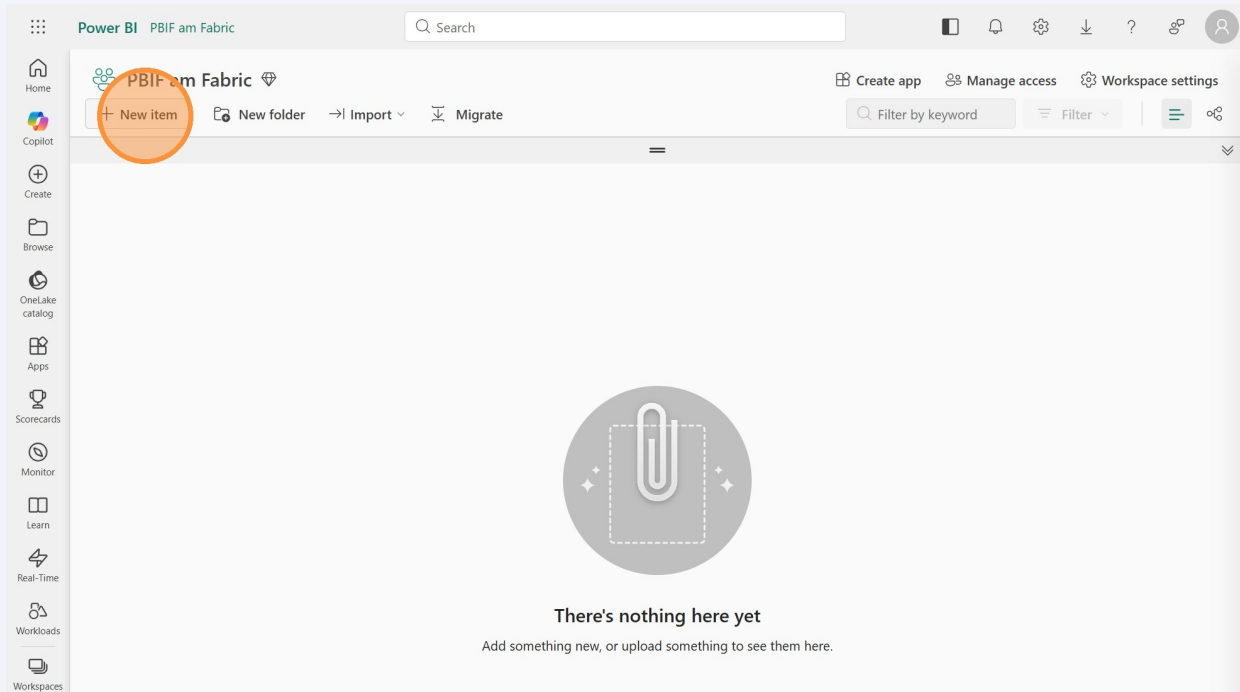

Click this icon on the right side to hide the task flow pane. Task flows are a feature to help you attach items to specific parts of an architectural diagram and allow you to filter more easily. They are out of the scope of our workshop today, but we encourage you to learn more about them.

Create a lakehouse

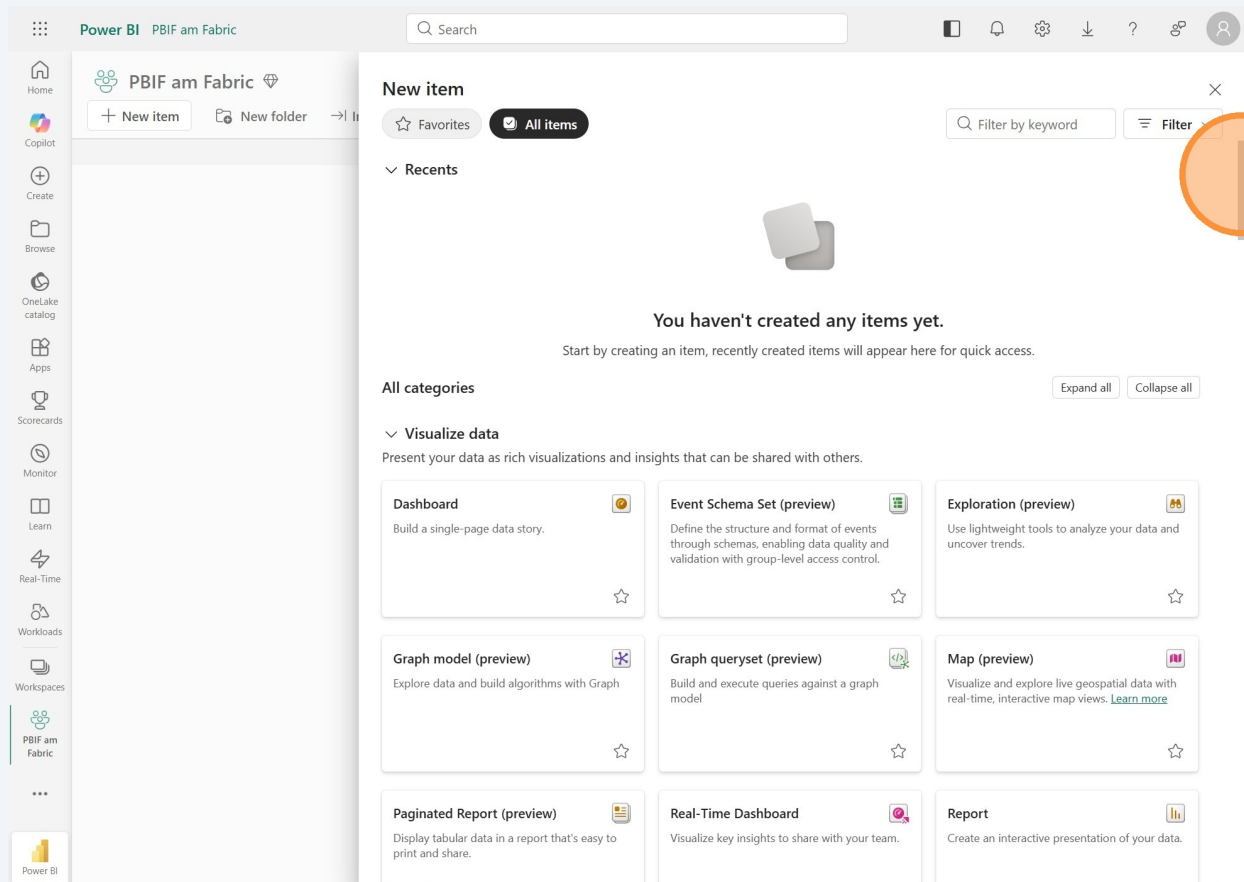

7

Click the "+ New item" button. This will pull up a pane that shows you all the different types of items you can create in Fabric.

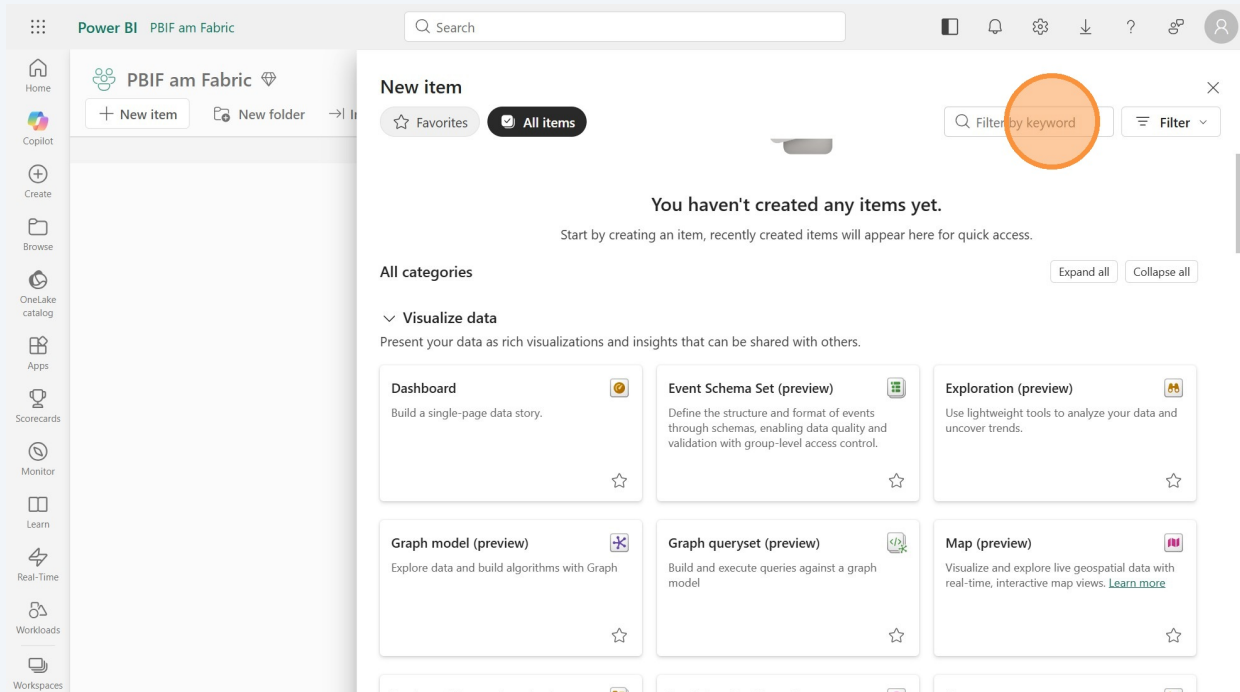

8

Take a look at all of those items! There are so many things we can create in Fabric. They're organized here by what they do, such as visualizing data, getting data, storing data, etc. You can either scroll through the list or filter it by the type or keyword.

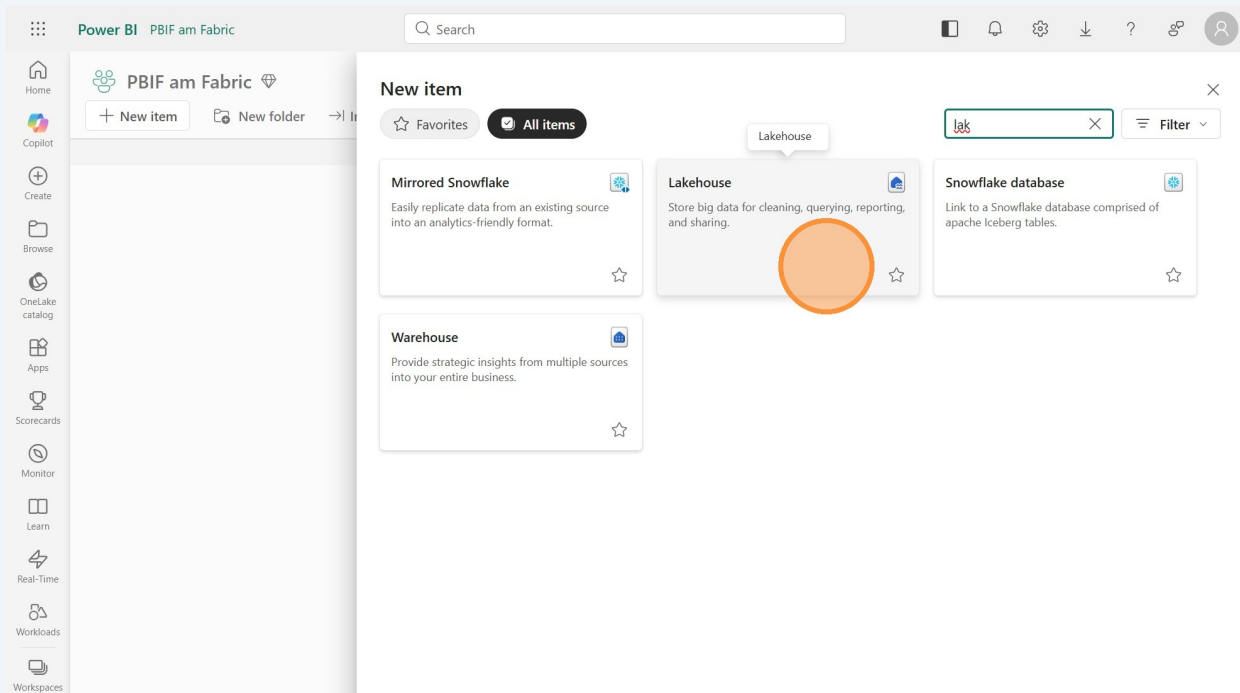

9

Click the "Filter by keyword" field and start typing "lake".

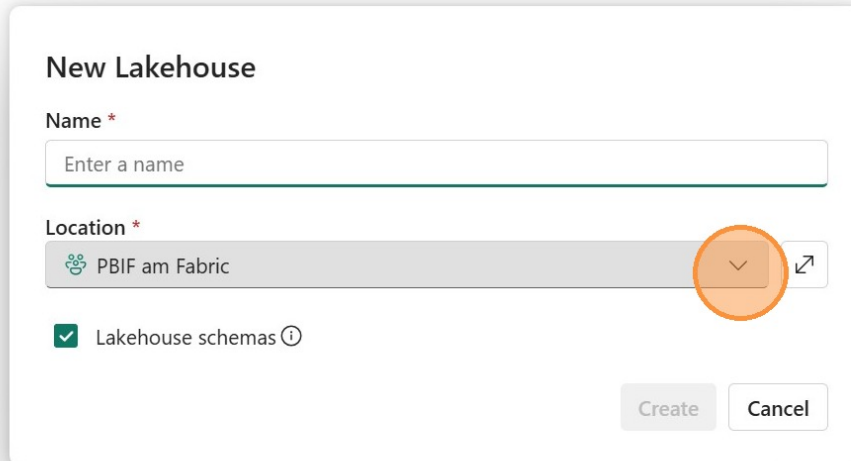

10

Click the Lakehouse tile to create a new lakehouse.

11

You can leave the location as-is, but notice that if you click the dropdown here you'll have options for where to create the lakehouse. It can be in a folder in this workspace, at the top level of this workspace, or even another workspace.

New Lakehouse

Add something new, or upload something to see them here.

12

Give the lakehouse a name, such as `fabcon_session_info` or `atlanta_lakehouse`. The name of the lakehouse only has to be unique within the workspace. You can name the lakehouse whatever you want. Call it `super_fun_times`, if you like!

Leave the “Lakehouse schemas” checkbox checked. Lakehouse schemas provide flexibility with organization of tables.

14

Take a little tour – notice you have a folder for “Tables” and for “Files” (if you kept the “Lakehouse schemas” checkbox checked, you’ll also see the dbo schema). The lakehouse also shows up in the navigation pane on the left side. At the top-right you can see the button that tells you you’re in the lakehouse. If you click it, you’ll see the option to hop over to the SQL analytics endpoint that was automatically created for you when you created the lakehouse.

15

Click on the name of your workspace on the left to go back to the workspace. You can also click "Workspaces" on the left-side navigation, and then choose your workspace. Either method will take you back to your workspace.

Tip! If your icon in the very bottom left side is the green F for Fabric instead of the yellow Power BI icon, the navigation is slightly different. Try out both and see what you prefer.

16

Congratulations! You now have a shiny new Fabric workspace with a lakehouse and an (automatically-created) associated SQL analytics endpoint.

The screenshot shows the Microsoft Fabric workspace 'GSMF 069'. The interface includes a left sidebar with navigation options like Home, Copilot, Create, Browse, OneLake catalog, Apps, Metrics, Monitor, Learn, Real-Time, Workspaces, and Power BI. The main area displays a table with the following data:

Name	Type	Task	Owner	Refreshed	Next refresh	Endorsement	Sensitivity	Included in app
fabcon_session_info	Lakehouse		GSMF De...	—	—	—	—	
fabcon_session_info	SQL analy...		GSMF De...	—	—	—	—
