

1b. Create a New Shortcut in a Lakehouse

We're going to connect to another lakehouse to get some data to work with. We know that the data we needs has already been loaded to another lakehouse and that we have been given permission to access it. Instead of copying this data, we can create a shortcut in our lakehouse. This gives us access to read the data without duplication.

1

Go to your Fabric workspace. Click the name of your lakehouse (not the SQL analytics endpoint below it).

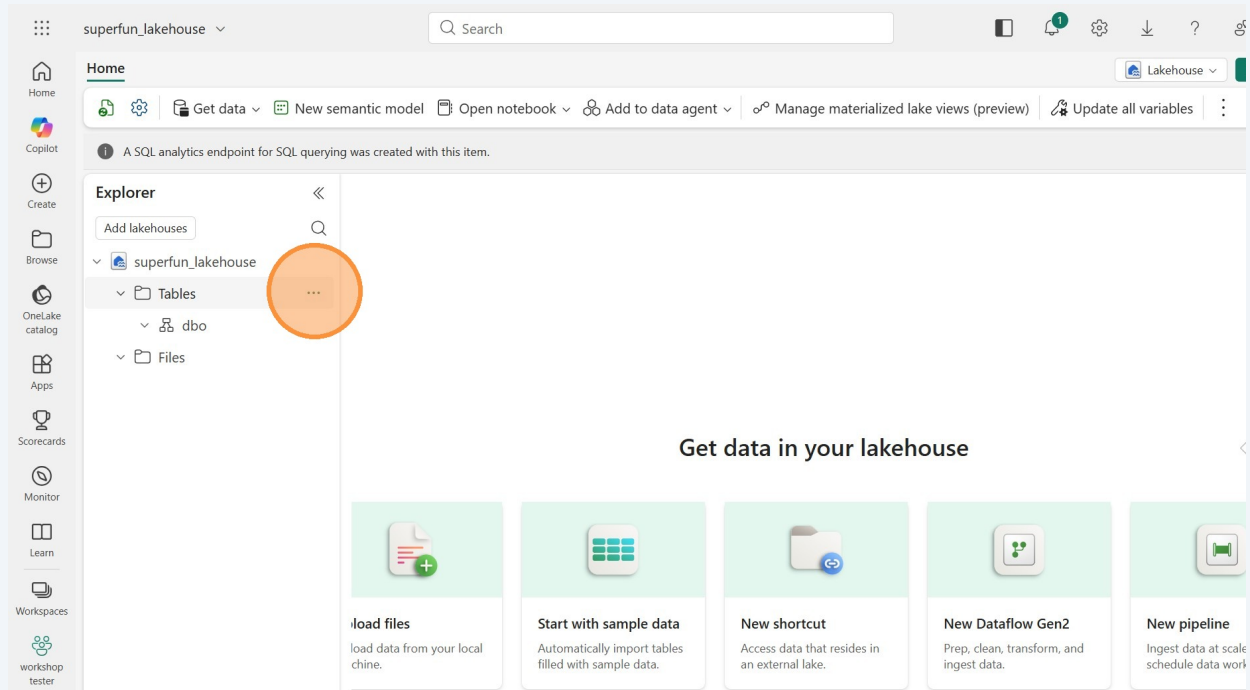

Alert! If you created your lakehouse with the "Lakehouse schemas" checkbox **unchecked**, you won't have schemas in your lakehouse and your shortcut options will be a little different than the instructions below. It's not a problem - you'll just have to select each table for the shortcut rather than the entire schema.

If you prefer your experience to match these instructions more closely, it's easy to go back to your workspace and create a new lakehouse with schemas before moving forward. If so, you might want to delete your original lakehouse so you don't get confused on which to use.

2

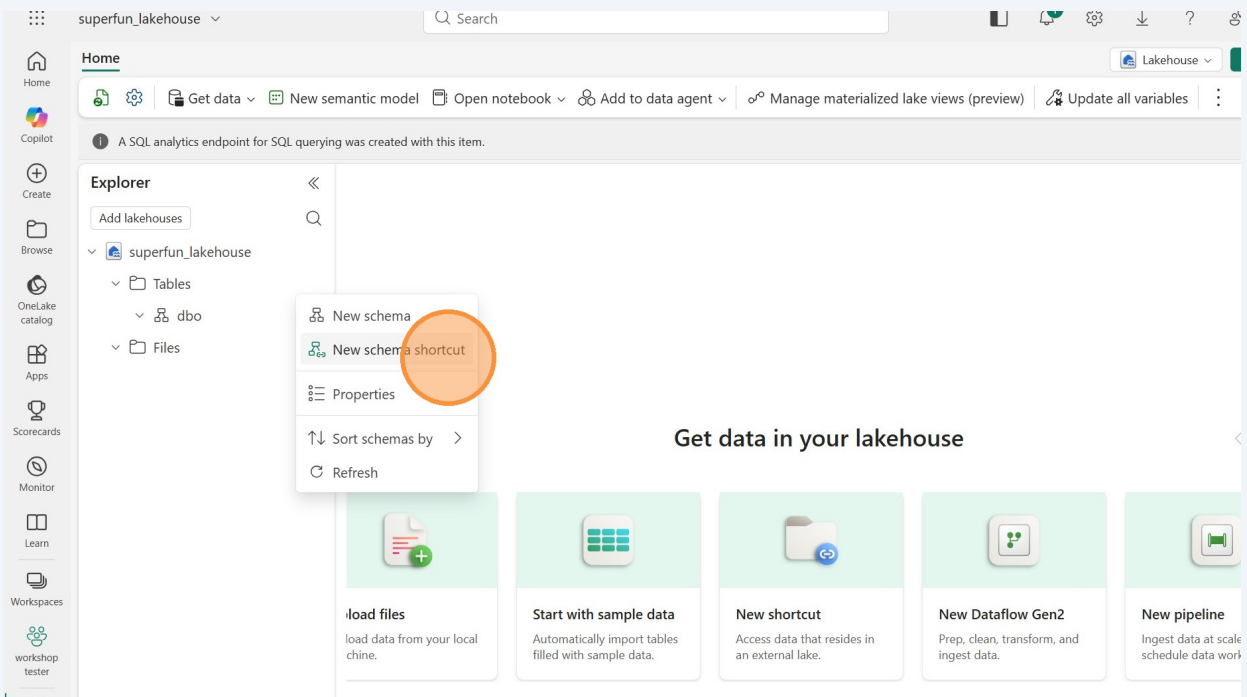

Like many things in Fabric, there are multiple ways to do something. To create a shortcut you can either go to "Get data" in the top menu and choose "New shortcut", or click on the 3 dots menu next to the "Tables" folder and choose "New shortcut." You can also click the big "New shortcut" button in the middle of the canvas.

We want to shortcut an entire schema, so we will make a schema shortcut. Click the 3 dots next to the "**Tables**" folder.

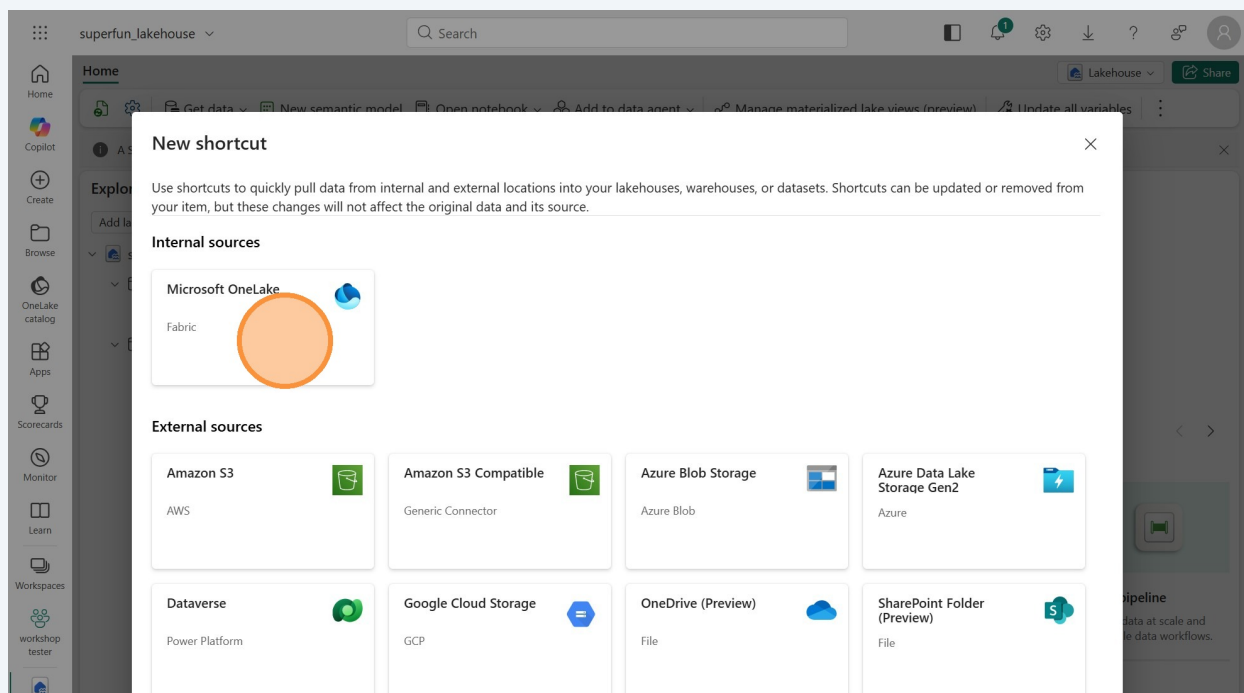

3

Click "New schema shortcut."
(If you didn't enable schemas, you'll do table shortcuts instead.)

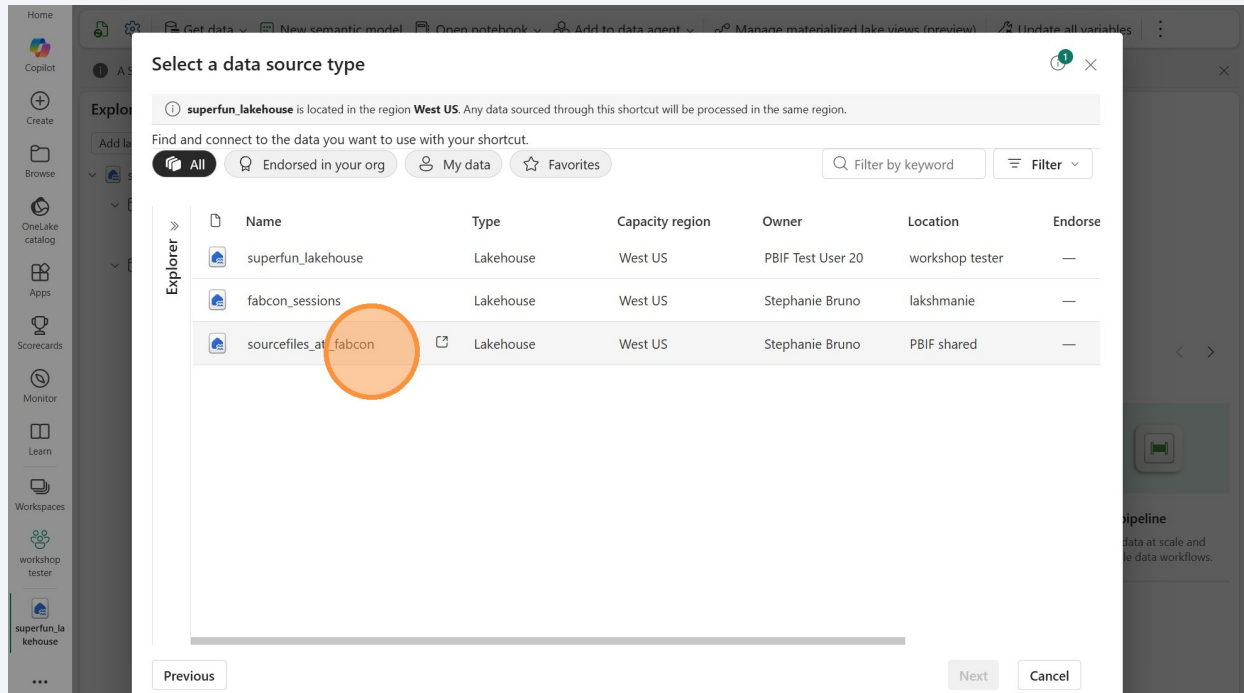

4

Choose the "Microsoft OneLake" tile from the "Internal sources" section. Notice the other external locations available from which you can also create shortcuts.

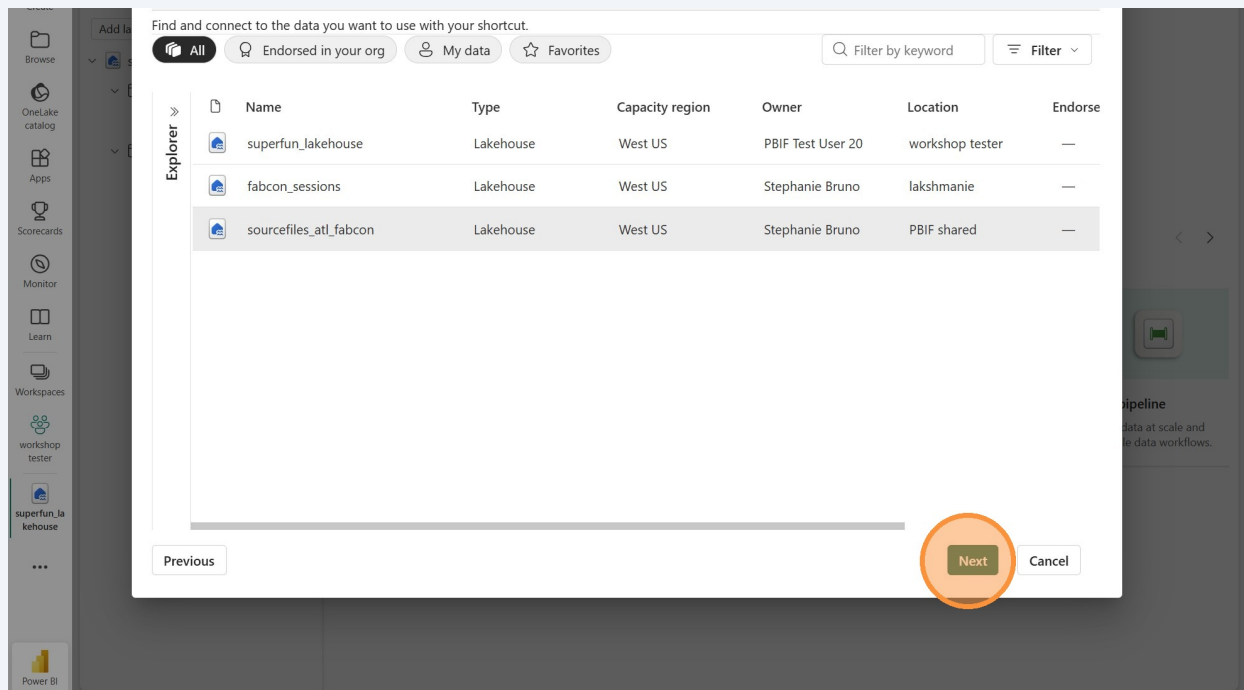

5

Click the "**sourcefiles_atl_fabcon**" lakehouse in the "PBIF shared" location. In this scenario, one of your colleagues has already downloaded the data and stored it in a shared lakehouse and has given you access to it.

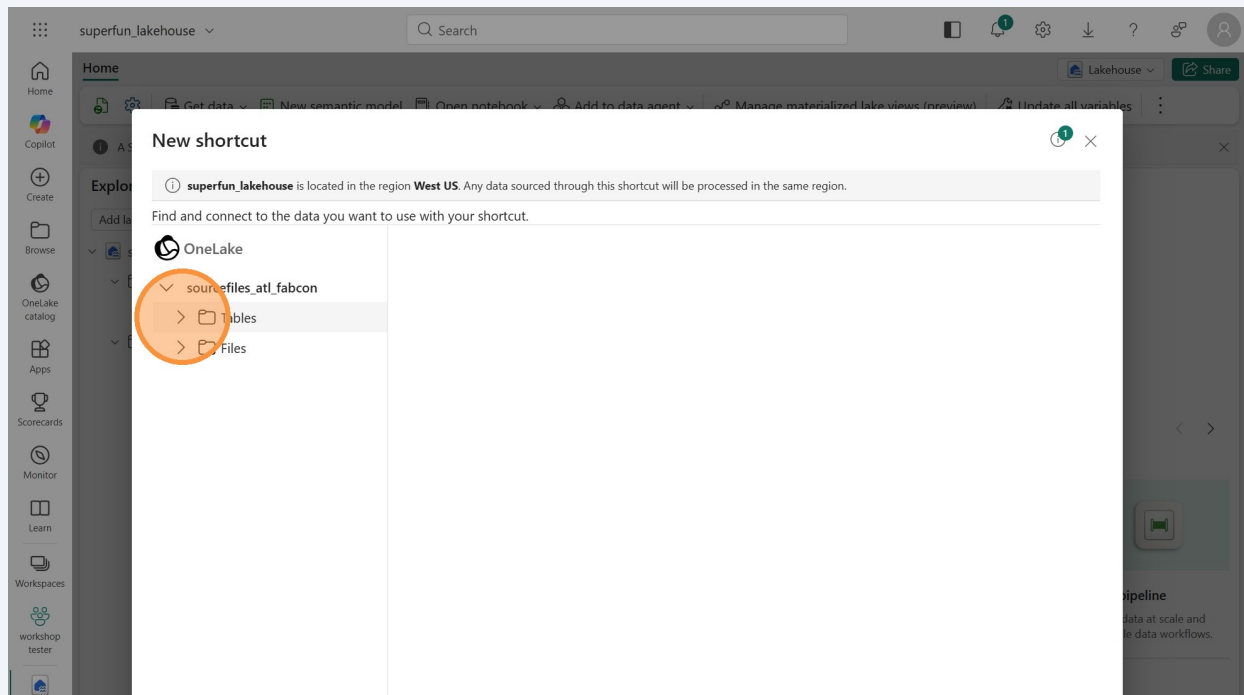

6

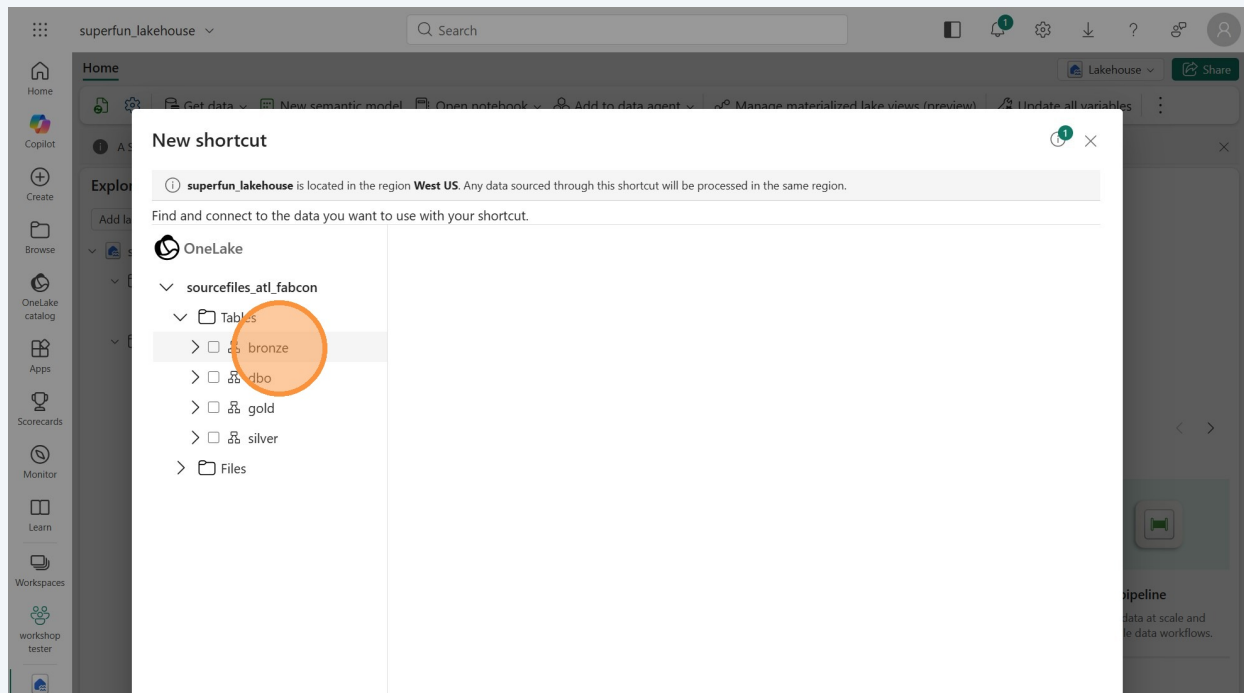

Click "Next"

7 Expand the "Tables" folder.

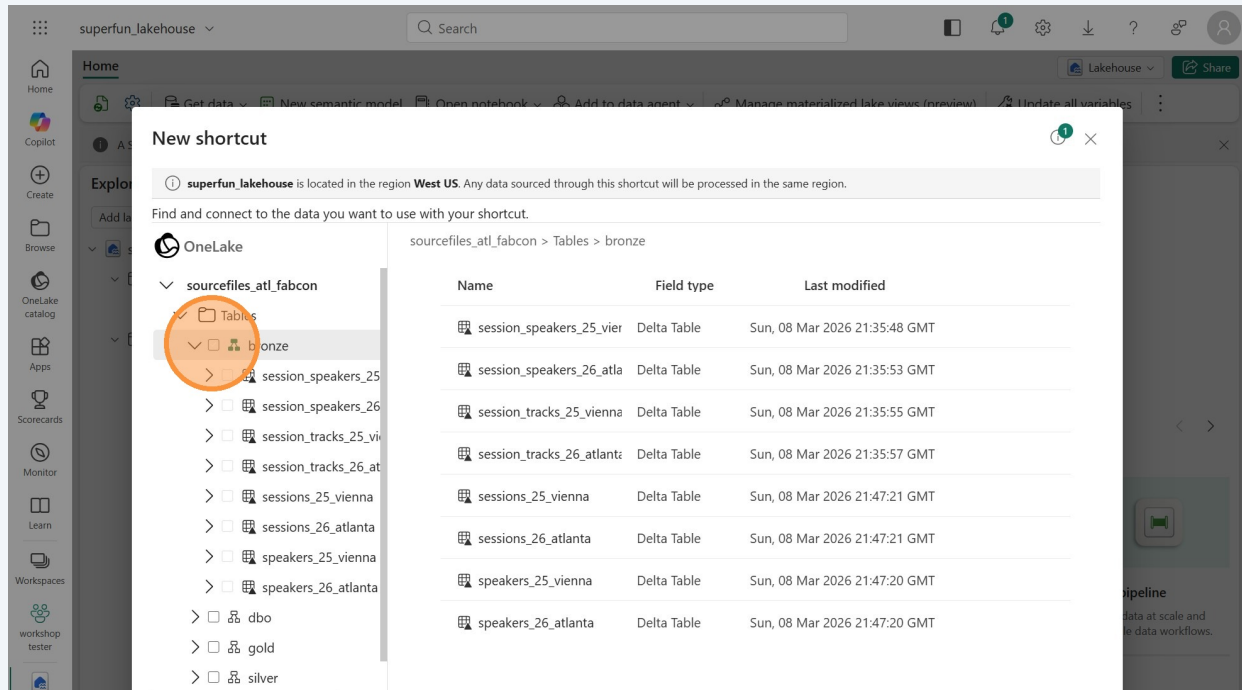

8 Click the "bronze" schema to get a preview of what tables are in it.

9

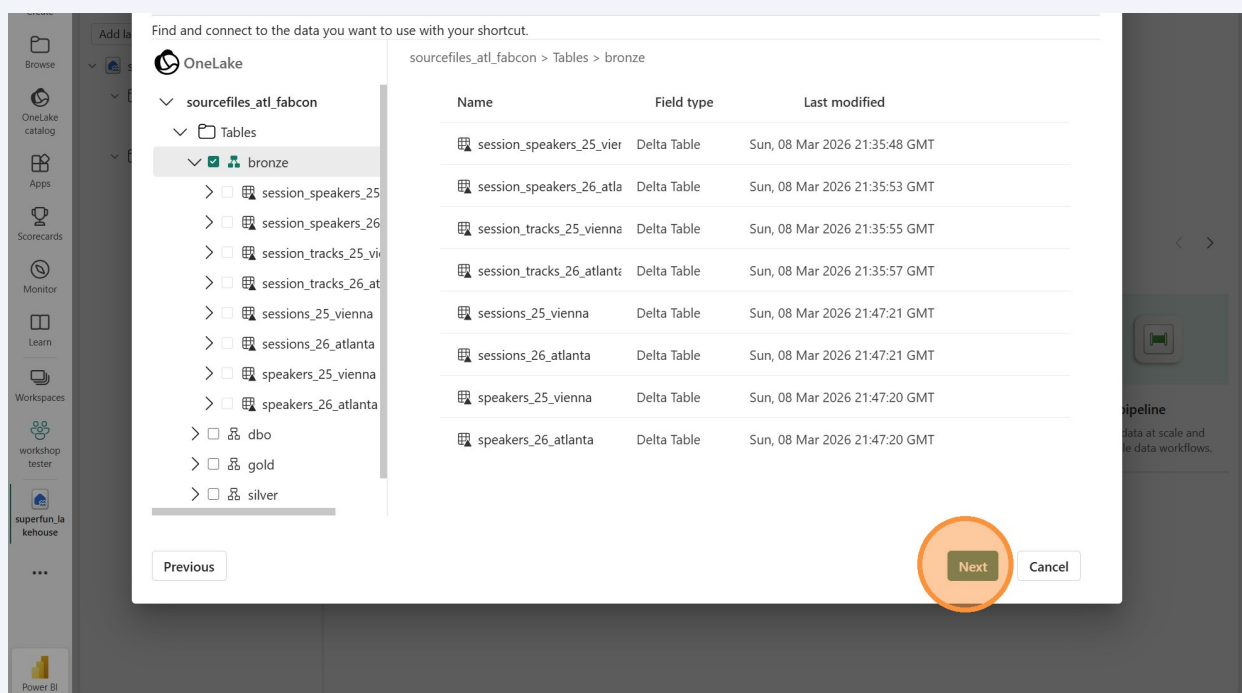

Click the checkbox next to the "bronze" schema to select it. Notice that when creating a schema shortcut, you don't have the option to select individual tables. You can create a shortcut to a single table with a table shortcut instead of a schema shortcut.

If you didn't select lakehouse schemas when you created your lakehouse, select all the tables under the bronze schema individually.

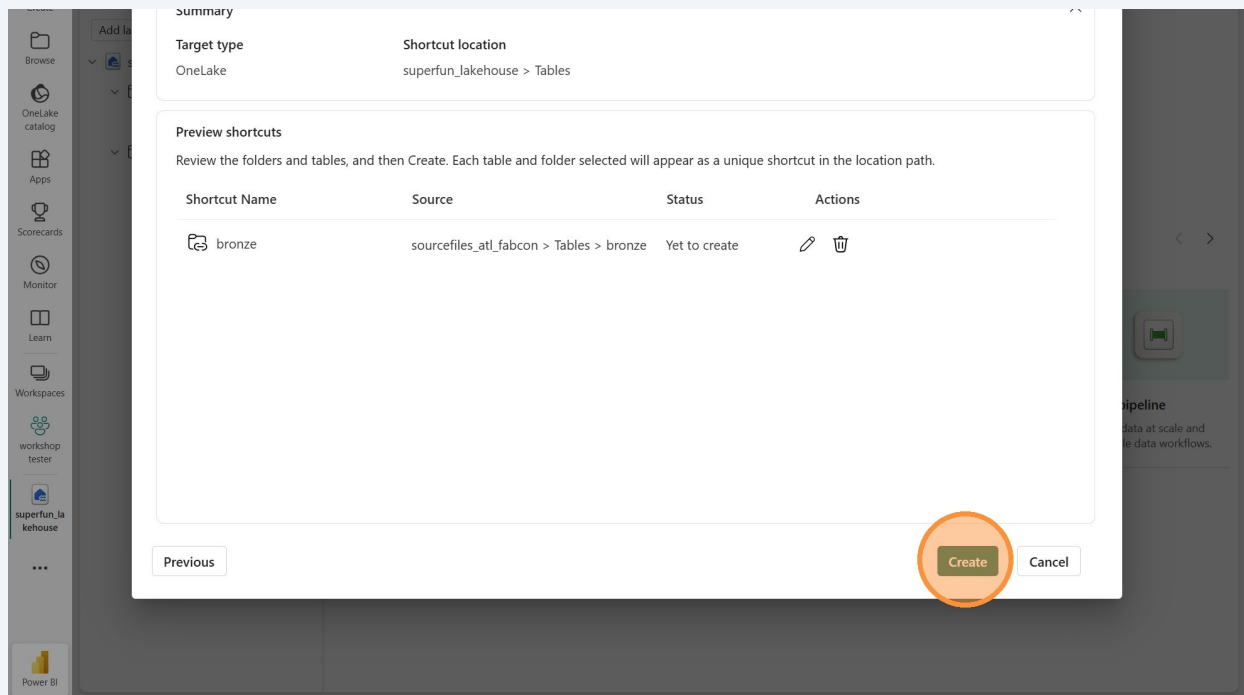

10

Click the "Next" button.

11

This page summarizes the shortcut that you're about to create. You can edit the name of the shortcut, but for now just leave it alone. Click the "Create" button.

12 Expand the bronze schema to see the tables.

You now have eight tables in your lakehouse, and they each have an icon of a tiny little link next to their names. This tells you that they are shortcuts. Shortcuts allow you to work with data that lives somewhere else *without duplicating it*.

Click one of the tables to see a preview of the data. You can also expand the table name to see the columns in the table. This table is showing us all the sessions for the FabCon Atlanta conference. Click some of the other tables to see what's in them.

The screenshot shows the Databricks interface. On the left, the 'superfun_lakehouse' schema is expanded, showing the 'bronze' schema. The 'sessions_26...' table is selected, and its data is displayed in a table view. The table has columns: '12L session_id', 'ABC Title', 'startdt', 'enddt', 'ABC Level', 'ABC Track', 'ABC Location', and 'ABC'. The data shows sessions for the FabCon Atlanta conference, including titles like 'Modern Data W...', 'Getting Started ...', 'Chat with Your D...', 'Hands-On Work...', 'A practical guide...', 'Design a Well-Ar...', 'Real-Time Intelli...', 'Mastering Data ...', 'Mastering SQL S...', 'SQL Server 2025...', 'Power BI Master...', 'Architecting Dat...', 'Beyond Buzzwor...', 'Mastering Fabric...', 'Mastering Datafi...', 'Engineering Exc...', 'Build AI-Ready a...', 'Building your da...', 'Deep dive into C...', 'Building Scalabl...', 'From Vectors to ...', 'KEYNOTE: Unifyi...', and 'AI for Ri: A Practi...'. The table is sorted by '12L session_id' in ascending order.

13

We're currently viewing the table view of the delta table. We can choose "File view" in this dropdown to get another view of this data.

The screenshot shows the Microsoft Fabric Lakehouse Explorer interface. On the left, the 'Explorer' pane shows the hierarchy: superfun_lakehouse > Tables > bronze > sessions_26_... (selected). The main pane displays the 'Table view' of the 'sessions_26_atlanta' table, showing 275 rows. A dropdown menu is open over the 'Table view' header, with 'File view' highlighted. The table data includes columns: ABC Title, startdt, enddt, ABC Level, ABC Track, ABC Location, and ABC.

ABC Title	startdt	enddt	ABC Level	ABC Track	ABC Location	ABC

14

The File view shows us the files that make up the delta table.

Click "Table view" to go back to the preview of the data in table form.

The screenshot shows the Microsoft Fabric Lakehouse Explorer interface. On the left, the 'Explorer' pane shows the hierarchy: superfun_lakehouse > Tables > bronze > sessions_26_... (selected). The main pane displays the 'File view' of the 'sessions_26_atlanta' table, showing 6 items. A dropdown menu is open over the 'File view' header, with 'Table view' highlighted. The file view shows the underlying files and folders of the delta table.
